Development of a Java-based Online School Enrollment System

By Group 2

What is O.S.E.S?

Online School Enrollment System is a Java-based application that digitizes the enrollment process. It combines student registration, course management, enrollment, tuition payment, and record management into one system. Instead of relying on manual paperwork, the system helps the registrar and other authorized users process enrollment more efficiently, maintain accurate records, and retrieve information quickly, resulting in a faster and more organized enrollment process.

The background of the slide features a photograph of two students, a woman and a man, sitting at a desk in a classroom or library. They are looking at a laptop. The image is covered with a semi-transparent yellow overlay. The title 'Introduction' is written in a large, bold, black font on a white rectangular background that has rounded corners and is positioned on the right side of the slide.

Introduction

The rapid development of digital technology has changed how educational institutions handle student enrollment and records. However, manual errors, redundant data, and ineffective workflows are frequently the outcome of traditional and disjointed processes. In order to overcome these obstacles, this study created a Java-based online school enrollment system that streamlines student registration, course management, enrollment, tuition payment, and administrative monitoring by utilizing MVC architecture, DAO, JDBC, and MySQL. The system seeks to enhance overall enrollment management, accuracy, and efficiency.

General Objectives:

- To design and develop a Java-based Online School Enrollment System that streamlines student registration, course management, enrollment, and tuition payment processes through a structured, database-driven application built on MVC architecture and DAO design pattern.

Scope and Delimitations

Scope

- The Study Focuses on a Java-based online school enrollment system, that aims to improve registrar operations and expedite enrollment processes using utilizes Model-View-Controller (MVC) and Data Access Object (DAO) design patterns and implements JDBC for communication with a MySQL database for data storage and retrieval.
- Key components include:
 - Dashboard: Summarizes registrar operations and activities related to students, courses, enrollments, and payments.
 - Enrollment and Tuition Payment Module: Processes tuition payments in various methods, enrolls students in multiple courses, and maintains transaction records with audit logging.
 - Course Management Module: Allows creation, updating, and organization of course information, including automatic computation of tuition fees.
 - Student Registration Module: Maintains standardized student records.
- Incorporates user-centered interface improvements to enhance administrative workflows, reduce repetitive tasks, and minimize manual errors.

Delimitations

- The study focuses on developing solely a desktop-based enrollment management program for administrative staff or registrars.
- Core processes supported include student registration, course management, enrollment, tuition payment, and dashboard monitoring.
- The system lacks user accounts or self-service portals for parents, teachers, students, or other stakeholders.
- It operates in a local network or standalone environment, utilizing a local MySQL database via JDBC.
- Features not included are online enrollment, cloud deployment, mobile accessibility, external payment gateway integration, notifications, and synchronization with other systems.
- Academic functions like class scheduling, grade management, attendance monitoring, faculty workload management, and LMS integration are excluded to concentrate on enrollment and tuition payment efficiency.

Significance of the Study

Significance of the Study

This study highlights the significance of an automated student registration system for various stakeholders.

- For registrar and administrative staff, it reduces human errors and speeds up processes by employing MVC architecture and DAO patterns.
- Students benefit from a more efficient registration and payment experience, minimizing paperwork and wait times.
- Professors receive better coordination through the Course Management module, streamlining access to class rosters and enrollment data.
- Additionally, future researchers and developers can utilize the documented design decisions as a reference for enhancing Java-based school management systems.

Conclusion

The Java-based Online School Enrollment System improved enrollment efficiency by merging Student Registration, Course Management, Enrollment, Tuition Payment, and Dashboard modules into one platform. Utilizing MVC architecture, DAO design pattern, JDBC, and MySQL, it offers a structured solution for managing records and payments while minimizing manual errors through automation. The system enhances admin workflows and demonstrates that sound software engineering and user-centered design lead to better accuracy and reliability in enrollment management, setting the stage for future enhancements.

**Thank you
so much**
